Python Programming Fundamentals Cheat Sheet

Package/Method	Description	Syntax and Code Example
AND	Returns 'True' if both statement1 and statement2 are 'True'. Otherwise, returns 'False'.	<pre>Example: marks = 90 attendance_percentage = 87 if marks >= 80 and attendance_percentage >= 85: print("qualify for honors") else: print("Not qualified for honors") # Output = qualify for honors</pre>
Class Definition	Defines a blueprint for creating objects and defining their attributes and behaviors.	<pre>Syntax: class ClassName: # Class attributes and methods Example: class Person: definit(self, name, age): self.name = name self.age = age</pre>
Define Function	A 'function' is a reusable block of code that performs a specific task or set of tasks when called.	Syntax: def function_name(parameters): # Function body Example: def greet(name): print("Hello,", name)

about:blank 1/10

		Syntax:
		variable1 == variable2
		Example 1:
		5 == 5
Equal(==)	Checks if two values are equal.	
		returns True
		Example 2:
		age = 25 age == 30
		age 50
		returns False
For Loop	A 'for' loop repeatedly executes a block of code for a specified number of iterations or over a sequence of elements (list, range,	Syntax:
	number of iterations or over a sequence of elements (list, range, string, etc.).	for variable in sequence: # Code to repeat
	string, etc.).	
		Example 1:
		for num in range(1, 10):
		print(num)
		Example 2:
		fruits = ["apple", "banana", "orange", "grape", "kiwi"] for fruit in fruits:
		for fruit in fruits: print(fruit)

Function Call A function call is the set of executing the code within the function using the provided arguments. Syntax: Frample 1; 5 > - 5 and 0 > - 5	/3/25, 3:03 PIVI	an an	out:blank
Function Call A function call is the set of executing the code within the function using the provided arguments. Fxample: groset("Alico") Syntax: variable: >= variable: Fxample 1: 5 >= 5 and 9 >= 5 Greater Than or Equal To(=) Checks if the value of variable1 is greater than or equal to variable2. Greater Than() Checks if the value of variable1 is greater than variable2. Syntax: variable2 >= variable2 Fxample 1: 5 >= 5 and 9 >= 5 coturns True Example 2: quantity = 185 minimum = 100 quantity >= 85 dinum Greater Than(c) Checks if the value of variable1 is greater than variable2. Syntax:			
Greater Than or Equal To(>=) Checks if the value of variable1 is greater than or equal to variable2. Example 1: 5 >= 5 and 9 >= 5 returns True Example 2: quantity = 185 minimum = 180 quantity >= minimum returns True Greater Than(>) Checks if the value of variable1 is greater than variable2. Syntax:	Function Call	A function call is the act of executing the code within the function using the provided arguments.	function_name(arguments) Example:
	Greater Than or Equal To(>=)	Checks if the value of variable1 is greater than or equal to variable2.	<pre>returns True Example 2: quantity = 105 minimum = 100 quantity >= minimum</pre>
	Greater Than(>)	Checks if the value of variable1 is greater than variable2.	Syntax:

		Example 1: 9 > 6 returns True Example 2: age = 20 max_age = 25 age > max_age
		returns False
		Syntax: if condition: #code block for if statement
If Statement	Executes code block `if` the condition is `True`.	Example: if temperature > 30: print("It's a hot day!")
If-Elif-Else	Executes the first code block if condition1 is `True`, otherwise checks condition2, and so on. If no condition is `True`, the else block is executed.	Syntax: if condition1: # Code if condition1 is True elif condition2: # Code if condition2 is True else: # Code if no condition is True
hout-blank		Example: score = 85 # Example score if score >= 90: print("You got an A!") elif score >= 80: print("You got a B.") else: print("You need to work harder.") # Output = You got a B.

13/25, 3.03 PIVI	a.	oout.piank
If-Else Statement	Executes the first code block if the condition is 'True', otherwise the second block.	<pre>Syntax: if condition: # Code, if condition is True else: # Code, if condition is False Example: if age >= 18: print("You're an adult.") else: print("You're not an adult yet.")</pre>
Less Than or Equal To(<=)	Checks if the value of variable1 is less than or equal to variable2.	Example 1: 5 <= 5 and 3 <= 5 returns True Example 2: size = 38 max_size = 40 size <= max_size

about:blank 5/10

8/3/25, 3:03 PM about:blank

```
Syntax:
                                                                                                                   variable1 < variable2
                                                                                                            Example 1:
                                                                                                                   4 < 6
Less Than(<)
                             Checks if the value of variable 1 is less than variable 2.
                                                                                                            returns True
                                                                                                            Example 2:
                                                                                                                   score = 60
                                                                                                                   passing_score = 65
score < passing_score
                                                                                                            returns True
Loop Controls
                              'break' exits the loop prematurely. 'continue' skips the rest of the
                                                                                                            Syntax:
                             current iteration and moves to the next iteration.
                                                                                                                   for: # Code to repeat
if # boolean statement
break
                                                                                                                   for: # Code to repeat
if # boolean statement
                                                                                                                             continue
                                                                                                            Example 1:
                                                                                                                    for num in range(1, 6):
                                                                                                                        if num == 3:
                                                                                                                        break
print(num)
                                                                                                            Example 2:
                                                                                                                   for num in range(1, 6):
    if num == 3:
        continue
                                                                                                                         print(num)
```

about:blank 6/10

/3/23, 3.03 PW		ooulbiank
NOT	Returns `True` if variable is `False`, and vice versa.	Syntax: not variable Example: isLocked = False print(not isLocked) returns True if the variable is False (i.e., unlocked).
Not Equal(!=)	Checks if two values are not equal.	Example: a = 10 b = 20 a != b returns True Example 2: count = 0 count != 0
		returns False

about:blank 7/10

8/3/25, 3:03 PM about:blank

```
Syntax:
                                                                                                                             object_name = ClassName(arguments)
Object Creation
                               Creates an instance of a class (object) using the class constructor.
                                                                                                                     Example:
                                                                                                                             person1 = Person("Alice", 25)
                                                                                                                     Syntax:
                                                                                                                             statement1 or statement2
                                                                                                                     Example:
                               Returns 'True' if either statement1 or statement2 (or both) are
                                                                                                                             "Farewell Party Invitation"
OR
                                                                                                                             grade = 12
if grade == 11 or grade == 12:
    print("Farewell Party Invitation")
                               'True'. Otherwise, returns 'False'.
                                                                                                                             else:
                                                                                                                                  print("Not eligible")
                                                                                                                     returns True
range()
                               Generates a sequence of numbers within a specified range.
                                                                                                                     Syntax:
                                                                                                                             range(stop)
range(start, stop)
range(start, stop, step)
                                                                                                                     Example:
                                                                                                                             range(5) #generates a sequence of integers from 0 to 4.
range(2, 10) #generates a sequence of integers from 2 to 9.
range(1, 11, 2) #generates odd integers from 1 to 9.
```

about:blank 8/10

75/25, 5.05 T W		
Return Statement	'Return' is a keyword used to send a value back from a function to its caller.	<pre>Syntax: return value Example: def add(a, b): return a + b result = add(3, 5)</pre>
Try-Except Block	Tries to execute the code in the try block. If an exception of the specified type occurs, the code in the except block is executed.	<pre>Syntax: try: # Code that might raise an exception except ExceptionType: # Code to handle the exception Example: try: num = int(input("Enter a number: ")) except ValueError: print("Invalid input. Please enter a valid number.")</pre>
Try-Except with Else Block	Code in the 'else' block is executed if no exception occurs in the try block.	<pre>Syntax: try: # Code that might raise an exception except ExceptionType: # Code to handle the exception else: # Code to execute if no exception occurs Example: try: num = int(input("Enter a number: ")) except ValueError: print("Invalid input. Please enter a valid number") else: print("You entered:", num)</pre>

about:blank 9/10

8/	3/25, 3:03 PM	ab	out:blank
	Try-Except with Finally Block	Code in the `finally` block always executes, regardless of whether an exception occurred.	<pre>Example: try: # Code that might raise an exception except ExceptionType: # Code to handle the exception finally: # Code that always executes Example: try: file = open("data.txt", "r") data = file.read() except FileNotFoundError: print("File not found.") finally: file.close()</pre>
	While Loop	A `while` loop repeatedly executes a block of code as long as a specified condition remains `True`.	<pre>Example: count = 0 while count < 5: print(count) count += 1</pre>
